 [linkedin.com/in/jida-li](https://www.linkedin.com/in/jida-li)  [github.com/jidalii](https://github.com/jidalii)  [jidalii.github.io](https://jidalii.github.io)

## Education

### Boston University(BU)

09/2021 - 05/2025

Bachelor of Arts in Computer Science, GPA: 3.93/4.00

Boston, MA

- **Relevant Coursework** : Computer Network, Distributed System, Computer System, Cryptography, Embedded System, Database Management, Machine Learning

## Technical Skills

**Languages**: Go, Solidity, Python, Circom, JavaScript/TypeScript, C, Shell, SQL/ NoSQL

**Frameworks & Libraries**: Gin, Foundry, The Graph, go-zero, Streamlit, FastAPI, Express

**Databases & Middleware**: Mysql, PostgreSQL, Redis, Kafka, MongoDB

**DevOps & CI/CD**: Git, Docker, Linux

## Experience

### Presto Labs

06/2025 - Present

Blockchain Developer

Shanghai

- Designed and implemented MPC signing service for ED25519 and Keccak-256 in Go.
- Integrated DeFi protocols, such as AaveV3, UniswapV3, LfjV2, allowing easy integration of the HFT strategies.
- Designed and developed realtime onchain CEX raw transfer feeder in Go.

### Complex Analytics and Scalable Processing (CASP) Research Lab, BU

09/2024 - 05/2025

Advised by Dr. Ioannis (John) Liagouris

Boston, MA

- Collaborated on a secure data pipeline for the Massachusetts Government's Executive Office of Labor and Workforce Development (EOLWD), enabling private and compliant workforce data reporting.
- Leveraged docTR and OpenCV to process and encode confidential documents with Python.
- Designed and implemented a user-friendly interface for Queryshield using **Streamlit** and **Python**, enabling secure data aggregation requests for data analysis via **Multiparty Computation (MPC)**.

### Neo Smart Economy

05/2024 - 09/2024, 12/2024 - 01/2025

Backend and Smart Contract Engineer Intern

Shanghai, China

- Designed and developed high-performance blockchain faucet for NeoX testnet, enabling efficient token distribution.
- Optimized **Golang Gin** server performance by implementing Ethereum client connection pooling with dynamic client configuration, improving QPS by **3x** and reducing latency to 40 ms.
- Integrated **Google reCAPTCHA v3** and **Redis-based rate limiting**, mitigating 99% of malicious traffic.
- Implemented the hybrid **Redis** persistence strategy (AOF + RDB), ensuring data durability and preventing cache loss.
- Applied the **Cache Aside** pattern and **Singleflight** mechanism to reduce **MySQL** database load by **40%**, preventing cache avalanche and breakdown during peak traffic.
- Containerized and deployed the server on **Google Cloud** using **Docker**.
- Enhanced the processing speed of **Gnark Zero-Knowledge Proof** by 4% for Neo X Blockchain node through aggregation.
- Audited and resolved bugs in the smart contract codes of Nichome, enhancing reliability and security.
- Developed a DEX in **Solidity** with **Supra** price oracle and **Masterchef** restaking mechanism.

## Selected Projects

### Pyth: Message Aggregation Platform | Go, gRPC, go-zero, Kafka, Redis, MySQL, ants

01/2025 - Present

- Architected high-throughput **go-zero** message push platform supporting billions of daily message deliveries across multiple channels, including SMS and emails.
- Designed **Kafka**-based partitioned architecture scaling to 15K msg/sec throughput using Topic partitioning and **gRPC** horizontal scaling, reducing end-to-end latency by 42%.
- Implemented resource isolation with dynamic thread pools via **ants** goroutine library, achieving 85% resource utilization while maintaining less than 5% GC overhead across 10+ message types.
- Engineered frequency and threshold message deduplication using sliding window rate limiting through **Redis sorted sets**, preventing duplicated consumptions and disturbance to users.

### MIT 6.4824: Distributed System Lab | Go

01/2025 - Present

- Designed and built a distributed MapReduce framework in Go, enabling parallel processing of large-scale dataset.
- Implemented **Raft consensus algorithm** from the ground up, incorporating **leader election**, **log replication**, and **log compaction** to ensure fault tolerance and strong consistency in distributed environments.
- Designed and optimized **concurrency and failure recovery** mechanisms using **goroutines**, **channels**, and **RPC**, improving system resilience and performance.

### Goodr.fun | Solidity, The Graph, Foundry, Next.js, Node.js

12/2024 - 02/2025

- Architected EVM-compatible meme token protocol for donations on Neo X, contributing social good with the power of memes.
- Engineered smart contracts for a charity donation, enabling winning tokens to launch on Carrot Swap on NeoX.
- Implemented a linear donation vesting mechanism to charities, ensuring secure and transparent distribution.
- Leveraged **The Graph** for indexed on-chain event analysis, creating real-time donation dashboards.
